Estimated Project Costs	14

The purpose of this report is to analyze the needs for radio communications by Public Safety Agencies, and other Public Agencies in Marin County and ways to provide for those needs. The present system structure is discussed, and feasible alternatives are examined. The recommended systems with their associated costs are including in this report.

Background

In June 1995, Marin County Department of Public Works issued a data collection request to acquire data from the governmental users of mobile radio in the County. The data was collected to determine how much radio equipment was in use, and a study was directed toward providing a unified approach for County Radio systems. The study also looked at needs of other governmental agencies, to determine if other needs could be satisfied with a joint system. The study also looked at existing dispatch centers. After detailed examination of the regulatory environment, frequency availability, technology trends, and end-user requirements, a trunked system was selected, with interconnection between these systems and public safety dispatch centers with an expansion of the County's microwave network.

A trunked system has all frequencies pooled and shared by all users. Users are assigned "talk groups" or digital group allocations, not individual channels. The larger the trunking frequency pool, the more efficient the system. For pooled systems, ideally users should not have all the same function, and not have peak periods that coincide. Trunking is based on statistical probability that all the users will not want to transmit at the same time. Trunking has been used in telephone lines for decades. The Emergency button on the radio has the highest priority. Trunking utilizes busy queuing to maintain established user priorities.

Of prime importance to all agencies was the availability of radio communications during any type of emergency. At the time, the recent Mt. Vision fire, floods, and earthquakes pointed out that the best method of communications for operational needs is a Communications System solely dedicated to the protection of life and property.

Topography

Marin County presents a very challenging design situation for radio communications. The topography of the County changes continuously from north to south, and from the west to the east. There are multiple hills, mountains, and valleys. The west side is sparsely populated, with the majority of the population on the east side.

The vegetation coverage varies from grasslands to heavy forestation, providing a unique propagation environment for a radio system. This environment has presented unique problems for radio broadcasters and cellular phone providers for years.

Existing Communication Systems

In February 1998, the Marin Emergency Radio Authority (MERA), a partnership of Marin's Cities, Towns, County, Water, and Fire Protection Districts was established to build a replacement for obsolete emergency radio systems. A 400 MHz T-Band system was designed

and purchased by MERA in December 1998. It has both limited capacity and limited coverage. The system was designed to accommodate 1,580 mobile and portable radios. Today it serves about 2,875 radios, which is far above the total originally anticipated. A summary of agencies and current radio quantities is attached as Appendix A. System usage for the year 2012 is attached as Appendix B.

MERA has identified frequencies or systems that are, or can be, tied/patched into the MERA system for local/regional/state/federal interoperability. These are channels that are licensed for mutual aid only or are actually licensed by others for mutual aid. The only exception is the MERA conventional channels which were licensed by the FCC as mobile only, and couldn't be licensed for mountain top. A complete listing is attached as Appendix C

Following is a summary of the elements of the existing system:

- a. Motorola Smartzone Version 3.0
- b. Phase 1 complaint system (narrowbanded to 12.5 KHz spacing)
- c. Over 200 digital talk groups
- d. Uses 33 radio frequencies (expanded from 30 to 33 in 2010)
- e. Of the contractually covered area reliability is as follows: 97% portable on hip outdoors in urban areas, 95% indoors in designated urban areas, and 95% mobile coverage in rural areas
- f. Fire Station alerting system to alert all Fire Stations by Dispatch
- g. Radio sites located in both Marin and Sonoma Counties: 13 RF (Radio Frequency) sites; 1 microwave only site, 1 prime site with the central computer, and 8 dispatch centers:

East Simulcast Sites – 11 Channels

- Big Rock
- San Pedro
- Dollar Hill
- Burdell
- Forbes
- Mill Valley City Hall
- Mt. Tiburon
- Civic Center (RX Only)
- Mt. Tam (RX Only)

West Simulcast Sites – 7 Channels

- Pt. Reyes
- Barnabe
- Mt. Tam

3 Intelli-repeater sites

- Sonoma Mt. – 6 channels
- Bay Hill Road in Bodega – 5 channels
- Stewart Point for Bolinas Area – 5 channels

Eight Dispatch Console Locations:

- Civic Center: (10) Positions, includes SR Fire
- Jail: (1) Position
- Woodacre: (3) Positions

- San Rafael Police: (4) Positions
- Novato PD: (3) Positions
- Central Marin PD: (4) Positions
- Fairfax: (1) Position
- Backup Dispatch Center: (2) Positions

h. MERA uses digital technology called “ASTRO” and FDMA (Frequency Division Multiple Access) modulation on 12.5 KHz channels, which:

- Provides improved and consistent audio quality over a wide range of system variations
- Provides more user information with each transmission
- Is more secure
- Provides a system design based on bit error rate and forward error correction, not just signal strength

i. Narrow band receivers have better adjacent channel rejection for less interference

j. All sites are tied together with digital links

k. All dispatch consoles are on a Wide-area-network

A map of the existing system coverage is found in Appendix D.

Timing of existing system obsolescence

Computer and software systems have a limited life, and over time elements are no longer supported by their manufacturers.

Motorola has provided an update on the support status of MERA’s Smartzone 3.0 system currently serving Marin County. This includes:

- Cancellation dates (or current production where applicable) for the high-level components of a 3.0 System.
- Motorola’s anticipated support period for the respective components.
- Identification of critical network components rapidly approaching “End of Life”.
- Replacement options for “End of Life” critical network component.
- Motorola resources for ongoing product support updates.

Based on this review, it was found the existing system is aging and approaching obsolescence. We recommend a new replacement system be operational in 2018 to ensure reliable emergency communications. We occasionally experience component malfunctions today, with the system reliability decreasing over time. Operating budgets for the existing system are forecasted to track at current rates through 2017. After 2017, we forecast exponential annual increases to maintain the existing system. Following is a summary of system components:

Component	Production Status
Master Site Expansion	December 2004 cancelled, cannot expand existing system
Simulcast/Voting CH	December 2007 cancelled, cannot add any new channels to existing system
Remote Sites	December 2007 canceled, cannot add any new sites to existing system
Console Positions	December 2009 cancelled, cannot add any new consoles to existing system
IR Channels	December 2009 cancelled, cannot add any new IR sites to existing system
Technical System Support	December 2009, limited technical system support on a year by year basis
Audio Switch (AEB) existing	December 2009 cancelled, cannot add or replace entire switch in system
Quantar – Site Radio	December 2011 cancelled, cannot add or replace entire radios in existing system

Component	Support
3000 Series Radios	2009 cancelled support
5000 Series Radios	Cannot buy after October 2013, support through November 2018, parts might be available through 2018
Master Site	December 2011, 6809 system and site controllers are no longer supported. Spare units were obtained from other agencies – limited capability
Simulcast/Voting CH	December 2014 scheduled support cancellation, repair parts might be available until 2018
Remote Sites	December 2014 scheduled support cancellation for 6809 system and site controllers. Spare units were obtained from other agencies – limited capability.
Console Positions	December 2016 scheduled support cancellation, repair parts might be available until 2018
IR Channels	December 2016 scheduled support cancellation, repair parts might be available until 2018
Technical System Support	December 2009, limited technical system support scheduled on a year by year basis
Quantar – Site Radio	December 2018 scheduled support cancellation, repair parts might be available until 2018
Audio Switch (AEB)	December 2018 scheduled support cancellation, repair parts might be available until 2018

For no longer produced system components, Motorola's indicates their support goal is to maintain parts and repair for up to 7 years from the cancellation date. The 7 year support plan is a goal, and not intended to be contractual or guaranteed, as parts and repair availability is dependent on product demand and production (for both Motorola and third party providers).

With all of this information provided the main items of concern are: Master Site and Remote Site System Components, i.e. 6809 system and site controllers. Through September 2013 Motorola has an upgrade option that would allow for continued support of the 6809's until 2018. This option includes the purchase and integration of a Master Site Switch, Smart X interface and Motorola Console interface. This project is currently being implemented in the Marin County

Emergency Operations Facility (EOF) project. The project is funded by County secured grants and County funds.

Existing system indebtedness

MERA used bond financing for the existing Smartzone 3.0 system. The last participating agency payment on the bond is due August 1, 2020 which will be paid by MERA reserves.

Volunteer Fire Department Paging

The existing volunteer paging system is a low band radio network owned by Marin County Fire Department, independent of the MERA system. Today it serves approximately 100 pagers. This system serves the following volunteer fire departments:

Bolinas Fire Protection District
Inverness Public Utility District
Muir Beach Volunteer Fire Department
Nicasio Volunteer Fire Department
Stinson Beach Fire Protection District
Tomales Volunteer Fire Company

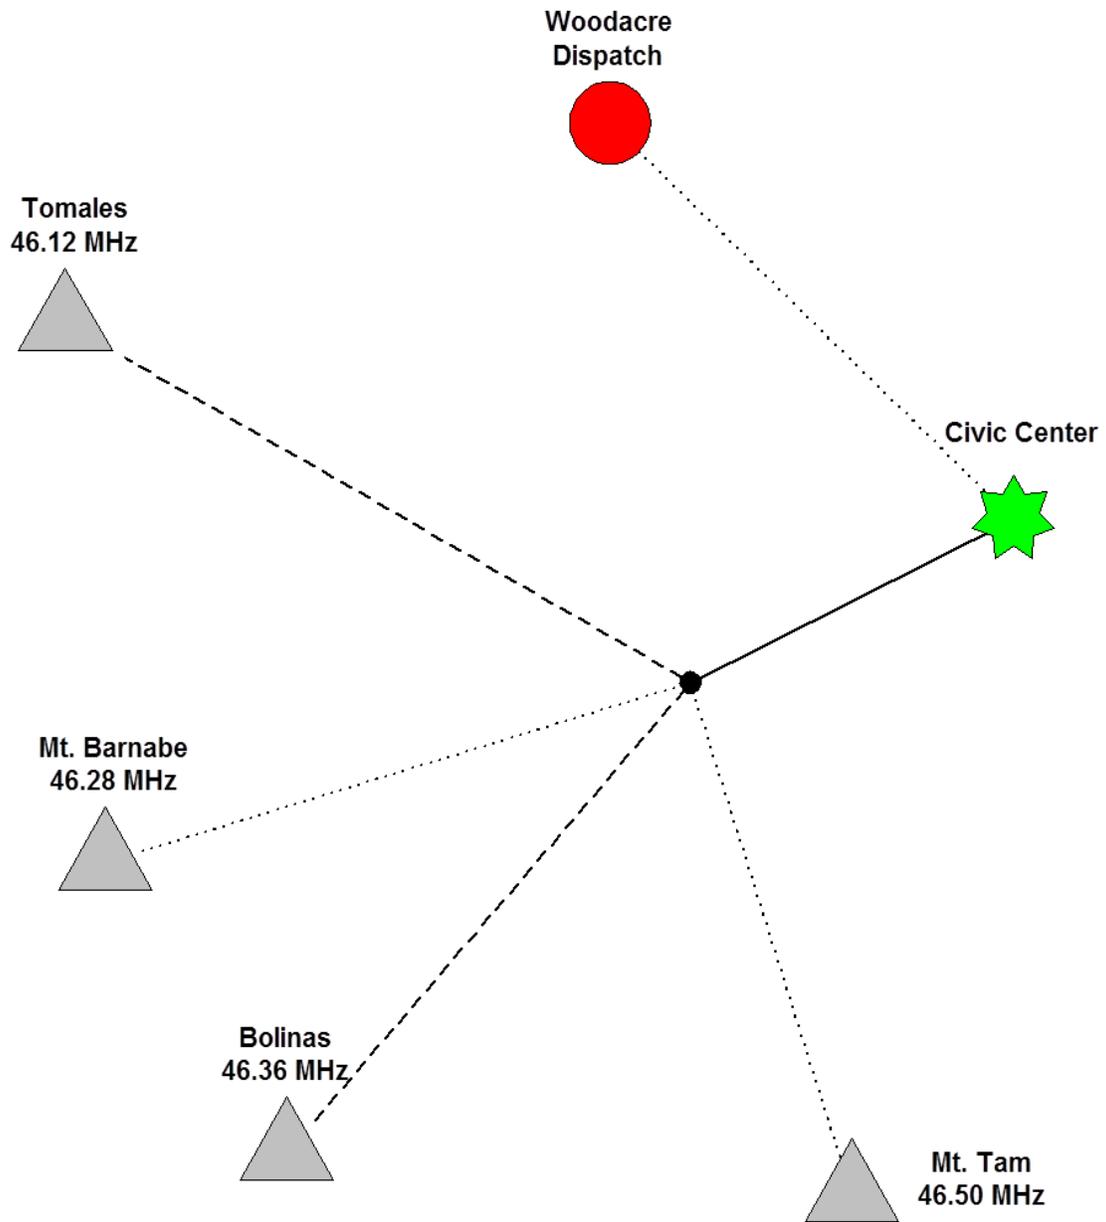

The Volunteer Paging system patches transmit only voice dispatch calls to individual receive only audio pagers. It does not provide digital paging (text) services. The Volunteer Paging system is only used to activate personal pagers worn by the volunteers or paging monitors used in their homes, offices, etc. The volunteer paging system does not activate any fire station alerting systems or sirens, open doors or sound station bells. Station alerting is accomplished on the MERA system and is different from volunteer paging.

Paging codes are: 1) selected by the Marin County dispatchers on their radio console; 2) generated from the radio dispatch consoles; and 3) sent simultaneously to the paging radio base stations at Mt. Barnabe, Mt. Tam, Bolinas Fire Station and Tomales Fire Station. Volunteers cannot talk back to dispatch on the one-way paging channels. Dispatch voice traffic is patched from the CTL-H2 talkgroup to the low band paging base stations so that any dispatch voice information is heard by the pagers. The pager does not hear communication from MERA radios directly.

All Next Generation radio consoles, available today, are capable of generating the required paging codes and "patching" to the existing Volunteer Paging system.

It is recommended that any new Request for Proposal issued by MERA for a Next Generation system include an option for consideration that provides Volunteer Paging on voice personal pagers, and possible other options for enhanced radio communications with personal pagers.

Marin County Fire Volunteer Fire Paging System

46.36 MHz - Novato Fire - F35

46.50 MHz - Southern Marin Fire - F6

46.12 MHz - County mutual Aid - F13

Federal Legislation summary:

Requirement to narrowband

In the Federal Communications Commission's "Communications Act of 1934 as Amended; Promotion of Spectrum Efficient Technologies on Certain Part 90 frequencies Report and Order and Further Notice of Proposed Rule Making - WT Docket No. 99-87 (1999) and Second Report and Order and Second Further Notice of Proposed Rule Making (2003) the FCC mandated several items:

Dates mandated for radio manufacturers:

- 1/1/2011: Equipment operating at greater than 12.5Khz shall not be manufactured or imported unless it demonstrates a 12.5KHz or less equivalent spectrum efficiency.
- 1/1/2011: Any new equipment submitted to the FCC for certification must be capable of operating at 6.25KHz channels or demonstrate an equivalent spectrum efficiency.
- 1/1/2015: Any new 700MHz equipment submitted to FCC for certification and sale must be capable of operating in 6.25KHz channels or demonstrate an equivalent spectrum efficiency.

Date mandated for radio users:

- 1/1/2011: Applications for new systems using 25KHz channels or a modification application that expands the authorized contour of an existing 25KHz station will not be accepted
- 1/1/2013: Phase 1 Narrowbanding, radio systems must operate in 12.5KHz or narrower channels.
- 1/1/2015: All new 700MHz systems must operate in 6.25KHz channels or demonstrate an equivalent spectrum efficiency.
- 1/1/2017 Phase 2 Narrowbanding, tentative date for systems other than 700MHz to operate in 6.25MHz channels or demonstrate an equivalent spectrum efficiency. In the notice, the FCC solicited comments on their preliminary determination, but has not yet issued a final notice.

The existing MERA system was designed to meet the FCC's Phase 1 Narrowbanding requirements. MERA's existing system does not comply, nor is it upgradeable in its present state, to operate in 6.25MHz channels or demonstrate equivalent spectrum efficiency. Due to the FCC's mandates to manufacturers that all equipment after January 2011 must be 6.25MHz technology, any Next Generation system MERA purchased will meet the FCC Phase 2 Narrowbanding requirements.

Requirement to vacate T-Band spectrum

On February 22, 2012, the President signed into law H.R. 3630, the "Middle Class Tax Relief and Job Creation Act of 2012," which provided that not later than 9 years after the date of enactment, or February 21, 2021, the T-Band spectrum currently in use by MERA must be reallocated. The legislation also provides that the Assistant Secretary can use auction proceeds

from a competitive bidding process for new licenses in this spectrum to make grants to recover relocation costs for the relocation of public safety entities from the T-Band spectrum. Agencies will have two years after the competitive bidding date to relocate.

Also under this same legislation is direction to the Federal Communications Commission to investigate the reallocation of microwave frequencies. MERA does have microwave frequencies that could be affected.

Next Generation System

System Design Report

A System Design Report, Marin County by AECOM was finalized for MERA on April 29, 2010, attached as Appendix E. The report presented plans for wireless voice and supporting interconnection systems for Marin County. These plans were jointly developed by the Marin County Project Team and AECOM and are focused on meeting the long term needs of Marin County.

Options identified included:

- a. MERA continue as currently configured and include 700MHz overlay.
- b. Upgrade MERA into a single P25 Phase 1 simulcast with present site layout.
- c. Upgrade MERA into a single P25 Phase 1 simulcast and add new sites.
- d. Countywide 700 MHz P25 Phase 2 system.

Licensing Potential

An Engineering Report for the County of Marin, Licensing Potential of the Radio Frequency Compatibility Report was finalized by CSI Telecommunications on June 1, 2010, and is attached as Appendix F. The report analyzes Table 4-3 of the AECOM report titled Radio Frequency Compatibility Report, which was a preliminary report issued prior to the AECOM System Design Report described above. The AECOM System Design Report contains the same information in Table 3-2, which is included in the discussion on UHF T-Band frequency availability.

CSI's task was to determine if the T-Band frequencies listed in the report could be licensed in compliance with 90.303 and 90.187 of the Federal Communications Commission Rules. Of the frequencies listed in the "Radio Frequency Compatibility Report" CSI found eight frequencies that possibly could be licensed without limitation of the 27 identified as needed in the AECOM report. Another ten frequencies might be licensed if Letters of Concurrence from other agencies were obtained. Sixteen frequencies have co-channel or adjacent channel issues that appear to make obtaining a Letter of Concurrence unlikely.

For this reason, Options b. and c. listed above in the AECOM System Design Report are likely infeasible.

Summary of Options				
Option	Frequencies available	Meets new federal regulations	Status	
a	yes	yes	Completed 2010	
b	no	no	Not recommended	
c	no	no	Not recommended	
d	yes	yes	Recommended	

Planned System Life

Systems are typically planned with a 15 to 20 year lifespan. This lifespan is used to forecast potential growth in users over that period, which determines the number of channels needed. For future planning purposes we recommend that fixed core equipment be planned for replacement in 15 years. Other infrastructure components will have a physical life in excess of 20 years which can be used with any replacement equipment.

Bay Area Regional Interoperable Communications System (BayRICS) Project

BayRICS is a collaborative planning effort that includes all 10 Bay Area Counties:

Alameda County
 Contra Costa County
 Marin County
 Napa County
 City and County of San Francisco
 San Mateo County
 Santa Clara County
 Santa Cruz County
 Solano County
 Sonoma County

The goal of the BayRICS project is multi-system interoperability throughout the Bay Area region. The interoperable BayRICS system-of-systems will provide reliable and cost-effective radio-to-radio voice communications for first responders within the region. The systems will be developed such that any radio can communicate with any other radio in the Bay Area, as defined and authorized within the BayRICS rules of use. The BayRICS project includes two key components to accomplish this level of interoperability:

- Development of 700 MHz P25 Phase 1 conventional simulcast systems in the

Bay Area

- Development of 700 MHz P25 Phase 2 trunked systems in the Bay Area

The P25 Inter-RF Subsystem Interface (ISSI) is a key component of BayRICS. Since BayRICS is considered a system-of-systems, the ISSI is designed to allow each radio communications system to be interconnected into a complete wide-area network of systems.

Under the guidance of Regional Interoperable Communications Workgroup and the allocation of UASI 2008 funds by the Bay Area Urban Area Security Initiative (Bay Area UASI) Funding Authority, a consultant was hired, Federal Engineering, to develop a Request for Proposal template that could be customized by individual operational areas, including Marin County. Federal Engineering developed a Requests for Proposals for a Marin County system.

The request is to provide a 700 MHz APCO Project 25 (P25) radio communications system to support mission critical communications within the County. The proposed communications system shall provide enhanced, two-way wireless communications capabilities to all users. The proposed system shall be capable of interoperable communications with the counties of the Bay Area.

Marin County Issues Request for Proposal

In an effort to improve public safety communications, in June 2010, the County of Marin invited proposals using the above described template (attached as Appendix G). Key elements of the project:

- P25 Phase 2 would allow MERA to utilize the allocated 700MHz channels
- Equipment is available from major manufacturers today
- Infrastructure change-out is required
- Mobile and Portable change-out would be required
- 700 MHz is the new frequency spectrum allocated to Public Safety
- 700 MHz channels in the Bay Area have been allocated and there is not a sufficient of channels available for everyone to convert to 700 MHz
- Marin has been allocated 27 - 700 MHz channels countywide
- The 700 MHz allocation includes all radio users in Marin County
- P25 Phase 2, network is required to meet future technical requirements
- Update of network microwave equipment is required due to the age of the existing equipment and increased data requirements of the newer technologies

The system will improve interoperability with all adjacent Bay Area Counties, and state and federal public safety mutual aid users and improve coverage. The system would consist of 15 sites. Tomales, Wolfback Ridge, and the North County site, are all new sites that will improve coverage in areas where needs were identified. This system is considered the baseline proposal for the purposes of this report. Alternatives to address additional coverage issues are covered in a later section.

Tomales
Pt. Reyes
Mt. Barnabe

Stewart Point (Bollinas)
Sonoma Mountain
Mt. Burdell

Big Rock Ridge
San Pedro Ridge
Forbes Hill

Dollar Hill
Mt. Tamalpais
Mill Valley City Hall

Mt. Tiburon
Wolfback Ridge
North County site

The RFP established the following as criteria for proposal evaluation:

- RFP compliance
- Coverage guarantee
- Vendor experience
- Cost of system
- Lifecycle costs
- Unit costs of subscriber equipment
- Capability, features, and functionality of the system
- Feasibility of design
- Warranty, maintenance, and support

In November 2010, presentations by proposal responders were given to a Marin County panel consisting of the following members: Jeff Franzini (SRPD); Mike Ridgway (SO); Jason Weber (CO FD); Jim Berg (NVPD); Eric Nickel (NVFD); Michael Frost, Shelly Nelson, Richard Chuck (CO DPW); Jim Irving(SMFD).

The panel was asked to evaluate the options from the AECOM report described above:

The panel recommended Option d; a Countywide 700 MHz P25 Phase 2 system. These proposals have now lapsed and MERA will need to issue a new RFP and conduct a new competitive process once funding is secured.

The project budget below is based on a system designed for 5,000 users, with initial acquisition of 3,000 radios, which exceeds the current radio usage. The additional 2,000 radios, if needed for future expansion, are not included in the recommended project budget.

During preparation of an RFP for a new system we recommend that MERA inventory the number of radios currently in use by MERA members, and identify which type of radio is needed for the end user types:

- Model 1: Basic model, typically identified with no keypad or display
- Model 2: Mid model, typically identified with limited keyboard and display
- Model 3: Advanced model, typically identified with full keypad and display

Status of Other Agency Transitions to 700 MHz

Completed 700 MHz P25 Phase 2 systems:

- City and County of San Francisco – 2010
- San Francisco International Airport – 2011
- East Bay Region Communications System (Alameda and Contra Costa Counties, not including Oakland) – 2011
- Oakland – 2011
- San Mateo County - 2012
- Other California agencies: Riverside, San Diego

Currently Transitioning to 700MHz P25 Phase 2 Systems

- Golden Gate Bridge District – 2011-2013

Currently Planning 700MHz P25 Phase 2 System projects

- Solano County – 700MHz Conventional 2012-2014 (project is not similar to Marin's because they have no interoperable system today, and no single platform)
- Napa County – 700MHz Conventional 2012-2013 (project is not similar to Marin's because they have no interoperable system today, and no single platform)
- Santa Clara County – 700MHz Conventional 2012-2014 (project is not similar to Marin's because they have no interoperable system today, and no single platform)
- Santa Cruz County – 700MHz Conventional 2012-2014 (project is not similar to Marin's because they have no interoperable system today, and no single platform)
- Nationwide agencies planning on using 700MHz is estimated to be greater than 100 agencies

Not currently planning a 700MHz P25 System at this time

- Sonoma County

FCC Licensing

In August 2011 Marin County Department of Public Works staff received approval from the California Region 6 700MHz Committee for allocation of the Marin County allotted 700MHz frequencies. This process took about a year. Once funding for frequency coordination is identified, and the FCC grants approval, the plan requires a five-year build out.

Estimated Project Costs

<i>Backbone Radio System:</i> Radio Communications System, Remote Site Equipment, Dispatch Console System, four new coverage improvement sites	\$14,600,000
<i>Microwave:</i> System replacement, network upgrade	3,600,000
<i>System Support:</i> Site upgrades, site alternatives, environmental compliance, permits, lease/property acquisition, FCC licensing, manufacturer training, end user training, test equipment, spare parts	9,900,000
<i>Mobile and Portable Radios:</i> 3,000 units	<u>11,900,000</u>
<i>Total</i>	\$40,000,000

Alternative coverage options

The baseline proposal budget above includes four new sites. The cost to add new MERA sites can vary due to the unique nature of each site. This includes items like access roads, sitework, environmental compliance and permitting, and acquiring easements/property rights. We

estimate the cost for a new MERA site could vary between \$2.5 and \$4 million. Several additional coverage areas were requested for consideration by MERA members in a new system. The Executive Board requested that the MERA Operational Issues Working Group review the requests and prioritize the list. This work was completed in June and July 2013.

All dispatch centers provided call data and information for the period June 2012 to June 2013. There were over 300,000 calls. The calls were plotted using GIS and reviewed at the areas where coverage improvements were requested. The Group considered the data and map coverage and developed the following recommendation for priority of new sites.

These priorities also take into consideration the following points:

- Improving coverage to areas where private property will be paying a parcel tax.
- Call volume
- Areas that have sites that can be added quickly.
- Areas that already have a known and viable work-around situation were given a lower priority.
- Partnerships should be pursued with other agencies for coverage areas that serve state and federal lands, such as Cal Trans, NPS, TAM, etc.

Recommended Priority:

1. Tomales
2. Tiburon
3. Wolfback Ridge
4. Muir Beach/Stinson Beach
5. 101/Redwood Landfill
6. North County
7. Golden Gate Bridge Toll Plaza
8. Bay Hill

MERA can establish which additional sites are to be included in the proposed system at this time, or establish a prioritization process and make a final decision at the system implementation phase, or a hybrid of the two. At the implementation stage, MERA will have more detailed cost information based on proposals, and information about any additional grant funds that are secured.

Likely grant resources

Following is an overview of possible grants over the next 5 years that might contribute towards the next generation system. However, over the next 5 years there is forecasted a reduction in grant funding from current levels from the federal government, including Homeland Security.

Marin County Sheriff and DPW Communications collaborate on the UASI formula grant programs. Under the UASI 2011 grant Marin is recommended to receive \$750,000. We understand that the UASI 2012 total will be between \$17 million to \$25 million. At that level, we expect the Marin share to be \$350,000. Forecasting that level forward, Marin could receive about \$2,150,000 for 2011 thru 2016.

There are other competitive grants that might be able to assist MERA with funding opportunities:

- COPS – Law enforcement grant
- PSIC – Public Safety Interoperable Communications Grant
- Byrne JAG – Byrne Justice Assistance Act Program – Law enforcement grant
- Flood Emergency Response Projects - Delta Communications Equipment Grant (Grant), the Grant Program to ensure that State and local agencies have a robust regional communication system in the Delta region to provide effective response to high water and flood emergencies
- EOC Grant Program – Emergency Operations Grant Program
- SHSGP-State Homeland Security Grant Program

Appendix C

Following are frequencies or systems that are, or can be, tied/patched into the MERA system for local/regional/state/federal interoperability:

UHF Mutual Channels programmed into subscriber units

MERA T-Band convention channels – 8 channels i.e. Car 1 &2, Flag 1 & 2, etc.
Petaluma PD 1, 2, and 3
Sonoma Sheriff Channels 1-5
GG Transit Channels 1-3
UCALL 40 + 4-Tacs
CALAW 4 (UHF CLEMARS)

Hard patched to MERA System (24/7)

Volunteer Fire Paging System – Low Band 46.12MHz at Tomales, 46.28MHz at Barnabe, 46.36MHz at Bolinas, and 46.50MHz at Tam

Capable of being patched into system on a as needed basis

White Fire/VFIRE
CDF CMD 1/CMD 2
UHF Medical Channels
EMS Mutual Aid
CAEMA Fire
San Rafael Fire VHF
CALAW 1 (VHF CLEMARS)
CHP CHANNELS
CLEAR 3 (VHF)
CLEAR 7 (UHF)
VCALL 10 + 3-TACs
7CALL 50 + 28-TACs
8CALL90 + 8-TACs
US Coast Guard
PRNSS
GGNRA
CESRS (State)

Standalone Interoperability

MCOE (Schools)
CALCORD

A map of the existing system is found in Appendix D

Draft

A report titled System Design Report; Marin County was finalized for MERA on April 29, 2010, attached as Appendix E.

Draft

An Engineering Report for the County of Marin, Licensing Potential of the Radio Frequency Compatibility Report was finalized by CSI Telecommunications on June 1, 2010, and is attached as Appendix F

Draft

proposals, Appendix G, for the provision of a Project 25 (P25) national interoperable communications standards

Draft

Summary of edits to draft:

7/10/13 Released to POC, Finance

Clarified Existing System indebtedness, add options table to Licensing Potential, clarified system life, added revised estimated project costs, added information to alternative coverage options,

Draft
